Problem set 4

2025-10-05

In the next problem set, we plan to explore the relationship between COVID-19 death rates and vaccination rates across US states by visually examining their correlation. This analysis will involve gathering COVID-19 related data from the CDC's API and then extensively processing it to merge the various datasets. Since the population sizes of states vary significantly, we will focus on comparing rates rather than absolute numbers. To facilitate this, we will also source population data from the US Census to accurately calculate these rates.

In this problem set we will learn how to extract and wrangle data from the data US Census and CDC APIs.

1. Get an API key from the US Census at https://api.census.gov/data/key_signup.html. You can't share this public key. But your code has to run on a TFs computer. Assume the TF will have a file in their working directory named census-key.R with the following one line of code:

census_key <- "58c8d90cfd1ff353c7a29530c666b1f08da9ec09"</pre>

Write a first line of code for your problem set that defines census_key by running the code in the file census-key.R.

```
source("census-key.R")
```

2. The US Census API User Guide provides details on how to leverage this valuable resource. We are interested in vintage population estimates for years 2020 and 2021. From the documentation we find that the *endpoint* is:

```
url <- "https://api.census.gov/data/2021/pep/population"</pre>
```

Use the httr2 package to construct the following GET request.

https://api.census.gov/data/2021/pep/population?get=POP_2020,POP_2021,NAME&for=state:*&key=Y0P_2021,POP_2021,NAME&for=state:*

Create an object called request of class httr2_request with this URL as an endpoint. Hint: Print out request to check that the URL matches what we want.

```
library(httr2)
request <- request(url) |>
  req_url_query(
    get = "POP_2020,POP_2021,NAME",
    `for` = "state:*",
    key = census_key
)
```

3. Make a request to the US Census API using the request object. Save the response to and object named response. Check the response status of your request and make sure it was successful. You can learn about *status codes* here.

```
response <- request |> req_perform()
response
```

```
<httr2_response>
```

GET https://api.census.gov/data/2021/pep/population?get=POP_2020%2CPOP_2021%2CNAME&for=state

Status: 200 OK

Content-Type: application/json Body: In memory (2112 bytes)

4. Use a function from the httr2 package to determine the content type of your response.

```
resp_content_type(response)
```

- [1] "application/json"
 - 5. Use just one line of code and one function to extract the data into a matrix. Hints: 1) Use the resp_body_json function. 2) The first row of the matrix will be the variable names and this OK as we will fix in the next exercise.

```
population <- resp_body_json(response, simplifyVector = TRUE)
population |>
head(10)
```

```

                             "Hawaii"
                                              "15"
                 "1441553"
 [5,] "887099"
                  "895376"
                              "South Dakota" "46"
[6,] "6920119"
                  "6975218"
                             "Tennessee"
                                              "47"
 [7,] "3114071"
                              "Nevada"
                                              "32"
                  "3143991"
[8,] "2117566"
                  "2115877"
                              "New Mexico"
                                              "35"
 [9,] "3188669"
                             "Towa"
                                              "19"
                  "3193079"
[10,] "2935880"
                  "2934582"
                              "Kansas"
                                              "20"
```

6. Examine the population matrix you just created. Notice that 1) it is not tidy, 2) the column types are not what we want, and 3) the first row is a header. Convert population to a tidy dataset. Remove the state ID column and change the name of the column with state names to state_name. Add a column with state abbreviations called state. Make sure you assign the abbreviations for DC and PR correctly. Hint: Use the janitor package to make the first row the header.

```
library(tidyverse)
library(janitor)
population <- population |>
  as tibble(.name repair = "minimal") |>
  row_to_names(row_number = 1) |>
  clean_names() |>
  select(-state) |>
  rename(state_name = name) |>
  pivot longer(
    cols = starts_with("pop_"),
    names_to = "year",
    values to = "population"
  ) |>
  mutate(
    year = str_remove(year, "pop_") |> as.integer(),
    population = as.numeric(population),
    state = case_when(
      state_name == "District of Columbia" ~ "DC",
      state_name == "Puerto Rico" ~ "PR",
      TRUE ~ state.abb[match(state_name, state.name)]
    )
  )
```

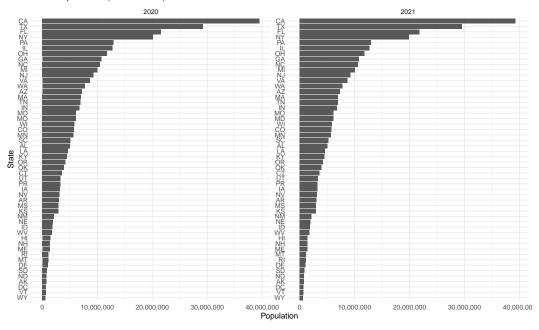

```
population|>
  head(10)
```

```
# A tibble: 10 x 4
   state_name
                 year population state
   <chr>
                <int>

                          6920119 TN
10 Tennessee
                 2021
                          6975218 TN
```

7. As a check, make a barplot of states' 2021 and 2022 populations. Show the state names in the y-axis ordered by population size. Hint: You will need to use reorder and use facet_wrap.

```
library(tidytext)
population |>
  filter(year %in% c(2020, 2021)) |>
  ggplot(aes(
    x = population,
    y = reorder_within(state, population, year)
  )) +
  geom_col() +
  facet_wrap(~ year, scales = "free_y") +
  scale_x_continuous(labels = scales::label_comma()) +
  scale_y_reordered() +
  labs(
    title = "State Populations (2020 & 2021)",
    x = "Population",
    y = "State"
  ) +
  theme_minimal(base_size = 6)
```

8. The following URL:

points to a JSON file that lists the states in the 10 Public Health Service (PHS) defined by CDC. We want to add these regions to the population dataset. To facilitate this create a data frame called regions that has two columns state_name, region, region_name. One of the regions has a long name. Change it to something shorter.

```
library(jsonlite)
library(tidyverse)

url <- "https://github.com/datasciencelabs/2025/raw/refs/heads/main/data/reg_
    ions.json"

regions <- fromJSON(url) |>
    as_tibble() |>
    unnest(states) |>
    transmute(
    state_name = states,
    region = as.integer(region),
    region_name = region_name
```

A tibble: 10 x 3

```
state_name region_region_name
                  <int> <chr>
   <chr>
1 Connecticut
                     1 New England
2 Maine
                     1 New England
3 Massachusetts 1 New England
4 New Hampshire 1 New England
5 Rhode Island
                     1 New England
6 Vermont
                       1 New England
7 New Jersey
                      2 NY and other
8 New York
                       2 NY and other
9 Puerto Rico
                       2 NY and other
10 Delaware
                       3 Mid-Atlantic
```

9. Add a region and region name columns to the population data frame.

```
population <- left_join(population, regions, by = "state_name")
population|>
head(10)
```

```
# A tibble: 10 x 6
```

```
state name
               year population state region region_name
  <chr>
              <int>
                        <dbl> <chr> <int> <chr>
                      3962031 OK

```

We see exactly 1,000 rows. We should be seeing over 52×3 rows per state.

By default, the CDC's Socrata API limits results to 1,000 rows per request.

11. The reason you see exactly 1,000 rows is because CDC has a default limit. You can change this limit by adding \$limit=10000000000 to the request. Rewrite the previous request to ensure that you receive all the data. Then wrangle the resulting data frame to produce a data frame with columns state, date (should be the end date) and cases. Make sure the cases are numeric and the dates are in Date ISO-8601 format.

```
api <- "https://data.cdc.gov/resource/pwn4-m3yp.json"</pre>
cases_raw <- request(api) |>
 req_url_query("$limit" = 10000000000) |>
 req perform() |>
 resp_body_json(simplifyDataFrame = TRUE)
cases <- as_tibble(cases_raw) |>
  mutate(
   state_name = state,
   date = as_date(ymd_hms(end_date, quiet = TRUE)),
    cases = parse_number(new_cases)
  ) |>
  select(state_name, date, cases) |>
  filter(!is.na(date) & !is.na(cases))|>
  arrange(state_name, date)
cases|>
  head(10)
```

A tibble: 10 x 3

	state_name	date	cases
	<chr></chr>	<date></date>	<dbl></dbl>
1	AK	2020-01-22	0
2	AK	2020-01-29	0
3	AK	2020-02-05	0
4	AK	2020-02-12	0
5	AK	2020-02-19	0
6	AK	2020-02-26	0
7	AK	2020-03-04	0
8	AK	2020-03-11	0
9	AK	2020-03-18	11
10	AK	2020-03-25	52

12. For 2020 and 2021, make a time series plot of cases per 100,000 versus time for each state. Stratify the plot by region name. Make sure to label you graph appropriately.

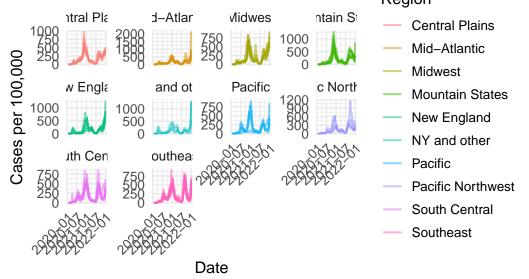

```
cases |>
mutate(
   state = state_name,
   date = as.Date(date)
```

```
) |>
filter(state %in% c(state.abb, "DC", "PR")) |>
left_join(
 population |>
   filter(year == 2021) |>
    select(state, region_name, population),
 by = "state"
) |>
mutate(
  cases_per_100k = (cases / population) * 1e5
) |>
filter(year(date) %in% c(2020, 2021)) |>
ggplot(aes(x = date, y = cases_per_100k, group = state, color =
→ region_name)) +
geom_line(alpha = 0.5, linewidth = 0.7) +
facet_wrap(~ region_name, scales = "free_y") +
labs(
 title = "COVID-19 Cases per 100,000 by State and Region (2020-2021)",
 subtitle = "Data from CDC API joined with US Census population

→ estimates",

 x = "Date",
 y = "Cases per 100,000",
 color = "Region"
) +
theme_minimal(base_size = 12) +
 axis.text.x = element_text(angle = 45, hjust = 1),
)
```

COVID-19 Cases per 100,000 by State and Region (202 Data from CDC API joined with US Census population estimates Region

13. The dates in the cases dataset are stored as character strings. Use the **lubridate** package to properly parse the **date** column, then create a summary table showing the total COVID-19 cases by month and year for 2020 and 2021. The table should have columns for year, month (as month name), and total cases across all states. Order by year and month. Use the **knitr** package and **kable()** function to display the results as a formatted table.

```
library(knitr)
library(lubridate)
cases |>
  mutate(
    date = ymd(date),
    year = year(date),
    month = month(date, label = TRUE, abbr = FALSE)
  ) |>
  filter(year %in% c(2020, 2021)) |>
  group_by(year, month) |>
  summarise(
    total_cases = sum(cases, na.rm = TRUE),
    .groups = "drop"
  ) |>
  arrange(year, month) |>
  kable(
```

```
caption = "Total COVID-19 Cases by Month and Year (2020-2021)",
format = "simple"
)
```

Table 1: Total COVID-19 Cases by Month and Year (2020-2021)

year	month	total_cases
2020	January	11
2020	February	68
2020	March	68245
2020	April	974032
2020	May	650943
2020	June	654904
2020	July	1989512

14. The following URL provides additional COVID-19 data from the CDC in JSON format:

```
deaths_url <- "https://data.cdc.gov/resource/9bhg-hcku.json"</pre>
```

Use httr2 to download COVID-19 death data from this endpoint. Make sure to remove the default limit to get all available data. Create a clean dataset called deaths with columns state, date, and deaths (renamed from the original column name). Ensure dates are in proper Date format and deaths are numeric.

```
deaths_raw <- request(deaths_url) |>
  req_url_query(`$limit` = 10000000000) |>
  req_perform() |>
  resp_body_json(simplifyDataFrame = TRUE)

deaths_raw|>
  head(10)
```

```
